glassAI's the world's first suite of AI-based systems for quotes, glass product sales, and production specifically applied to the niche of glass shops.

saleAI: Uses a customer's previous quotes with AI to determine a quote price without human contact. saleAI detects urgency, hesitation on an order or what the customer or contractor is attracted to and gives recommendations and generates time-limited discounts for products the customer or contractor may be interested in. Payment systems are integrated so the customer can close the sale faster. Prices are also auto-adjusted by both market demand, customer demand, current inventory, and rush delivery status. You may see an ROI (return on investment) within **around 6 months to 1 year** from starting to use this. This product will be able to be used via a web app on PC.

cueAI: Predicts inventory and production needs using past sale counts and AI systems to minimize inventory tax and manage stock. cueAI can also predict maintenance needa and use saleAI to auto-adjust pricing. cueAI also integrates systems to auto-order stock, make prices higher using saleAI or as a last resort switch suppliers in times in which supplier delays or geopolitical issues are expected. You can expect a quick ROI within **1 to 2 years** from starting to use this. This product will be able to be used both on PC as a web application and on iOS or Android via an app.

oStat: Module which combines the power of AI and data pulled from other programs, like A+W or Optima, to determine live production status, which is handed off to the customer through a web platform. It can predict delays using maintenance schedules, inventory, and other factors. orderStat can also use quality control systems and give a score to the customer of how good their glass is expected to be. You can expect a ROI within **1 to 2 years** from starting to use this. This product will be available both through a web app on PC and on a mobile app for tablets or phones.

insAI: Uses AI to predict installation times based on job size, location, and complexity, including factoring in weather and local contractor availability. This integrates with the customer's web portal or mobile app to display updates on the ETA for installation. You can expect a return on investment, combined with all the other modules, in **around 1-2 years**. For the business owner and employees, this will be available through a web app on PC, and through a mobile app. For the customer, as described above, the product will be available through both a web app and through a mobile app.

kiAI: An AI-powered system designed for sale kiosks, being an extension of saleAI. The customer can describe for what is the glass going to be used and AI then determines the

customer's glass needs and the configuration of the glass. A key feature is the ability to create a quote for any project at home using the web or mobile apps, then simply scanning a QR code in the kiosk to be able to sign-in automatically and finalize the order process in-person.

Pricing:

- glassAI Core is priced at $5 per user/month and $60 per user/year for access to smaller saleAI and orderStat models with a 5,000 query/month limit which if it is hit the service will not be available; top-up packages are available starting at $20 for 2,000 queries. **This package is recommended for small businesses getting started which can't afford or are not large enough to use glassAI Pro.**

- glassAI Pro is priced at $400 per user/month and $3500 per user/year for access to saleAI's full model, cueAI, orderStat's full model and installAI mobile and web tools, with a 25,000 query/month limit and add-on packages available; if the business hits the query limit their service will not be interrupted but the company's priority in AI usage will be lowered. **This package is recommended for medium businesses which are managing more customers and need a larger AI model.**

- glassAI Ultra is priced at $750 per user/month and $7000 per user/year for full access to all the glassAI web and mobile tools with a 500,000 query/month limit and add-on package availability, with the only usage throttling being done when there is high usage traffic. **This package is recommended for large businesses which don't need the offline 24/7 uptime capability of our offline on-premises systems.**

- Offline, no-cloud, on-premises systems without query limits start at $250,000 upfront with yearly maintenance and upgrades at 20% of the initial cost, with larger-scale solutions starting at $400,000.

This full suite requires around **$10 million** to complete, including:

- $5 million for research and development (R&D);
- $2.5 million for quality assurance & quality testing;

- and $2.5 million for additional expenses, such as marketing or cloud service expenses.

We are able to make an **MVP** (Minimum Viable Product) in around 2-3 years' time with as little funding as $1000.
